

Truss Jibs

Truss Jib - A truss jib is actually utilized to pick up and position trusses. It is actually an extended jib attachment that is outfitted with a triangular or pyramid shaped frame. Typically, truss jibs are mounted on machinery like a skid steer loader, a compact telehandler or even a forklift making use of a quick-coupler accessory.

Older models of cranes have deep triangular truss jibs which are assembled from standard open structural shapes that are fastened with rivets or bolts. On these style jibs, there are few if any welds. Each riveted or bolted joint is susceptible to rust and thus needs frequent upkeep and check up.

Truss jibs are made with a back-to-back collection of lacing members separated by the width of the flange thickness of another structural member. This particular design causes narrow separation amid the smooth surfaces of the lacings. There is limited access and little room to preserve and clean them against rust. Numerous bolts loosen and rust inside their bores and should be changed.
